                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fig. with the invention of the invention of the invention are discontinuously published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identificing averaged grown (I) is useful in constitutional technique.
                                                         New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess biodiversity -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC polypeptide (II) sequences (I) is useful as hybridisation probes, CC polyperase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (CC to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC specification, but was obtained in electronic format directly from WIPO as the polyperase of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ABB20407
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore
                                                                                                                                                                                                                                                                                                                                     26-MAY-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide #2437
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21335-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays.
                                                                                                                                                                                                                                                  (MOLE-)
                                                                                                                                                                                                                                                                                              21-SEP-2000;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

R;Rounsley, S.D.; Lin, X.; Ketchum, K.A.; Crosby, M.L.; Brandon, R.C.; Sykes submitted to the EMBL Data Library, October 1998
A;Description: Arabidopsis thaliana chromosome II BAC T30B22 genomic sequenc A;Reference number: 214149
A;Reference number: 214149
A;Rocession: T00416
A;Status: translated from GB/EMBL/DDBJ
A;Molecule type: DNA
A;Residues: 1-577 <ROU>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C; Geneti

"Characterization of a full-length cDNA for rabbit factor x.";

"Thromb. Res. 85:503-514(1997).

-i- FUNCTION: FACTOR XA IS A VITAMIN K-DEPENDENT GLYCOPROTEIN THAT CONVERTS PROTHROMBIN TO THROMBIN IN THE PRESENCE OF FACTOR VA, CA++, AND PHOSEHOLIPID DURING BLOOD CLOTTING.

-i- CATALYTIC ACTIVITY: Preferential cleavage: Arg-|-Thr and then Arg-|-Ile bonds in prothrombin to form thrombin.

-i- SUBUNIT: THE TWO CHAINS ARE FORMED FROM A SINGLE-CHAIN PRECURSOR BY THE EXCISION OF TWO ARG RESIDUES AND ARE HELD TOGETHER BY 1 OR MORE DISULFIDE BONDS.

-i- PTM: THE VITAMIN K-DEPENDENT, ENZYMATIC CARBOXYLATION OF SOME GLOTAMIC ACID RESIDUES ALLOWS THE MODIFIED PROTEIN TO BIND CALCITING OF THE TATTERY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LT 5

Submitted (APR-2001) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: ATP + H(2)O - ADP + PHOSPHATE.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY (E1-E2 ATPASES). SUBFAMILY IB.
                                                                                                                                                                                                                                                SEQUENCE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence represents a monomeric monocyclic peptide of the invention, CC whose 3-dimensional structure is modelled on the expose loop of human CC WEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring CC beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein CC and cyclising the peptides by oxidising the cysteine residues. The CC monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked CC monocyclic peptides) and a cyclic peptide with at least one amino acid CC deleted prior to cyclisation are used to interfere with angiogenesis, CC neovascularisation or lymphangiogenesis in a mammal with a condition CC characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, CC rerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive commone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver confection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid CC complature. The monomeric and bicyclic peptides are used to interfere CC with at least one biological activity induced by VEGF. VEGF-C or -D and CC chronic inflammation, especially rheumatoid arthritis, psoriasis and CC chronic sequelation, especially rheumatoid arthritis, psoriasis and CC chronic inflammation, especially rheumatoid arthritis, psoriasis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             beta beta carbon separation distances on opposite antiparallel strands of CC a peptide loop fragment from an exposed loop of a growth factor protein CC and cyclising the peptide by oxidising the cysteine residues. The CC monocyclic peptides, dimeric bloyclic peptides (comprising 2 linked CC monocyclic peptides) and a cyclic peptide with at least one amino acid CC deleted prior to cyclisation are used to interfere with angiogenesis, conevascularisation or lymphanglogenesis in a mammal with a condition of characterised by angiogenesis, neovascularisation or lymphanglogenesis, neovascularisation or lymphanglogenesis, or characterised by angiogenesis, neovascularisation or lymphanglogenesis. CC The condition is diabetic retinopathy, psoriasis, arthropathy, cc hemangloma, vascularised malignant or benign tumour, post-recovery createrovascular accident, post-angioplasty restemosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive commone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver crequelae, hypertension induced neovascular sequelae, or chronic liver confection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid cor brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere covascularies to the bological activity induced by VEGF, VEGF. Or -D and condition inflammation, especially rheumatoid arthritis, psoriasis and condition characterises and condition characterises and condition constitution in peripheral limbs or in lungs, peritoneal cavity pleura, or band arthritis, psoriasis and condition characterised by VEGF. VEGF. Or -D and condition in peripheral sequence in the peripheral condition with an anti-inflammatory agent, to treat a condition characterise by provides and condition characterises and condition characterises and condition characterises and condition characterises and condi

                                                                                                                                                                                                                                                                                                                                                        beta-beta carbon separation distances on opposite antiparallel strands of CC a peptide loop fragment from an exposed loop of a growth factor protein CC and cyclising the peptides, dimeric bicyclic peptides (comprising 2 linked CC monocyclic peptides) and a cyclic peptide with at least one amino acid CC monocyclic peptides) and a cyclic peptide with at least one amino acid CC deleted prior to cyclisation are used to interfere with angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition CC characterised by angiogenesis, neovascularisation or lymphangiogenesis. CC The condition is diabetic retinopathy, psoriasis, arthropathy.
CC characterised by angiogenesis, neovascularisation or lymphangiogenesis. CC The condition is diabetic retinopathy, psoriasis, arthropathy.
CC chemangioma, vascularised malignant or benign tumour, post-recovery condition accident, post-angioplasty restenosis, head, heat or cold crauma, substance-induced neovascularisation of the liver, excessive condition. The peptides are also used to modulate vascular permeability of in amammal (the mammal has a condition characterised by fluid accumulature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -p and conversed to interfere also used in combination with an anti-inflammatory agent, to treat a converse contrains and accombination with an anti-inflammatory agent, to treat a converse contrains and accombination with an anti-inflammatory agent.

The DNA is derived from Nocardia corallina and comprises 4 open reading frames. ORFs amoA and amoC encode subunits 1 and 2 of the alkene monoxygenase enzyme and ORF amoD encodes a reductase capable of transferring electrons

                                                                               Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclising a loop fragment from an exposed loop of a growth factor protein toxidizing the cysteine residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAR81469-R81472 are protein products of the Nocardia corallina strain B-276 alkene mono-oxygenase gene. The gene encodes 4 protein products amoA, amoB, amoC and amoD derived from the 3 different reading frames of the operon. The gene is useful for the production of indigo via oxidation of indole. Nocardia corallina can be cultured in a medium contg. Indole and will readily oxidise the indole yielding indigo into the culture medium. E. coli may also be transformed with the alkene mono-oxygenase gene and used as above to efficiently produce indigo
                                                                                                                                                                                                                                                                                                                                                                                               18-JAN-2000; 2000US-0176293.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC VEGFD (vascular endothelial growth factor). The invention relates to a CC method of producing a monomeric monocyclic peptide by a measuring CC beta-beta carbon separation distances on opposite antiparallel strands of CC a peptide loop fragment from an exposed loop of a growth factor protein CC and cyclising the peptide by oxidising the cysteine residues. The CC monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked CC monocyclic peptides) and a cyclic peptide with at least one amino acid CC deleted prior to cyclisation are used to interfere with anglogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition CC characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetto retinopathy, psoriasis, atthropathy, CC hemangioma, vascularised malignant or benign tumour, post-recovery CC cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance induced neovascularisation of the liver, excessive componer related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid cacumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and carbonic inference and a combination with an anti-inflammator, to treat and carbonic information accombination with an anti-inflammator, to treat and carbonic information and combination with an anti-inflammator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psociasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restensis, head, heat or columns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclising a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2001-442248/47.
                                                                                                                                                                                                                                                                                                        gene therapy; antisense therapy; cancer; immune disor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel foetal polypeptides encoded by polynucleotides comprising one of 477 sequences fully defined in the specification. The foetal polynucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders, growth disorders (e.g. osteoporosis), thrombolytic disorders, nervous system disorders and inflammation. The present sequence is a polypeptide encoded by a cDNA assembled using an expressed sequence tag (EST) found to be expressed in human foetal tissue cDNA libraries.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a foot supplement. (II) and its binding partners are useful in medical considers involving aberrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations considered the rypes of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human cC diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed constitution, but was obtained in electronic format directly from WIPO as ferming and acid sequence and in electronic format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ω
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a rat cubilin protein. Cubilin is a ligand-CC binding, epithelial glycoprotein receptor that facilitates uptake of CC intrinsic factor/vitamin B12 complexes in intestines and kidney. It is CC also involved in endocytosis and trafficking of light immunoglobulin CC chains in renal proximal tubule cells. Host cells containing a vector CC comprising the rat cubilin DNA sequence can be used for the recombinant CC expression of the protein. Cubilin, or its fragments, are used to treat CC or reduce toxicity, particularly in kidneys, spleen, brain, liver, heart CC and thyroid. Cubulin mutations may also be implicated in idiopathic CC proteinuria, fetal malformation, poor fetal development and spontaneous abortions. Cubilin may also be used to raise specific antibodies, used CC for its detection, or clones that express it, in standard immunoassays. CC arguments of cubilin DNA can also be used to detect cubilin mRNA in cell CC arguments of cubilin DNA can also be used to detect cubilin in the urine CC are indicative of kidney damage. Sequences AAY27021-35 represent EGF crepeat sequences of rat cubilin and from homologous regions of other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     vegetative reticulate body form of Chlamydia rather than with the refractile elementary body form. The invention includes: a vaccine directed against the reticulate body form of Chlamydia comprising 1 or more infection-specific proteins (see AAY32170-78), including IncA, IncB and IncC; methods of using and producing such a vaccine; methods for detection of infection-specific antibodies or antigens in a biological specimen; and a method of using therapeutic agents specifically directed against infection-specific peptides, or the genes that code for such peptides, to treat chlamydial infection.
                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG1840-ABLIG175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABB57779 standard; Protein; 562 AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 13;

                                                                                                                                                         sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/chemokinetic activity, haemastatic and thrombolytic activity, receptor/ ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a directing extracellular secretion of a polypeptide or the insertion of a
                                                                                                                                                                                                                                                                                                                                                                                                     human secreted proteins, and encode the proteins given in AAY12681 to AAY12913, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid
